

## HOW TO USE

### Checking the brake function

Before starting work, always check operation of the brake: To do this, lift, pull or tension and lower or release a load over a short distance with the unit. When the hand chain is released, the load must be held in any position. This check is intended to ensure that even at temperatures below 0 °C, the brake disks are not frozen. Repeat it at least twice, before starting further work.

### Lifting the load

Pulling the hand chain in clockwise direction will raise the load.

### Mitari Overload protection

The overload protection is set at approx. 125% - 140% x the workload. When the load limit is exceeded, the overload protection device is activated and prevents further lifting of the load, lowering is still possible.

### Lowering the load

Pulling the hand chain in anticlockwise direction will lower the load.
